## Sitemap Sample:

**SNAP2STORE** is an interactive mobile app designed to find, track, curate and share physical media discovered in every store. It allows for real-time, seamless update of location and condition of media found by other people, and allows for tagging of said media, the shops they were found at, and the classification of these media for convenience.

As observed from the sitemap above, SNAP2STORE contains 5 main pages: Login, Home, Profile, Discover, and Support.

Login is the default page if the user is not logged in and has not saved their login information beforehand. There is a login for administrators recognized by special, restricted login information.

Home contains the liked or the favorites that the user added; the map that shows various locations of media discovered or saved by the user; and posts/contributions that the user made.

Profile houses the basic details about the user. They can also access profile settings to change or edit anything about their profile and settings. There is also a history section of the user's contributions, likes, and ratings.

Discover page takes the user to the primary source of finding and cataloguing physical media. The search feature has many filters to effectively help zero in the media at hand.

Finally, Support page provides help for users, technical and whatnot; the report feature handles any misbehavior in the application; about us tells all about the dev team; and the donate is donation for the dev team.
